## Mathematical statistics

October $9^{\text {th }}, 2018$
Lecture 13: Confidence intervals

| Week 1 | Probability reviews |
| :---: | :---: |
| Week 2 | Chapter 6: Statistics and Sampling Distributions |
| Week 4 | Chapter 7: Point Estimation |
| Week 7 | Chapter 8: Confidence Intervals |
| Week 10 | Chapter 9: Test of Hypothesis |
| Week 14 | Regression |

## Overview

8.1 Basic properties of confidence intervals (Cls)

- Interpreting Cls
- General principles to derive Cl
8.2 Large-sample confidence intervals for a population mean
- Using the Central Limit Theorem to derive Cls
8.3 Intervals based on normal distribution
- Using Student's t-distribution
8.4 Cls for standard deviation

## Confidence Intervals

- Let $X_{1}, X_{2}, \ldots, X_{n}$ be a random sample from a distribution $f(x, \theta)$
- In Chapter 7, we learnt methods to construct an estimate $\hat{\theta}$ of $\theta$
- Goal: we want to indicate the degree of uncertainty associated with this random prediction
- One way to do so is to construct a confidence interval $[\hat{\theta}-a, \hat{\theta}+b]$ such that

$$
P[\theta \in[\hat{\theta}-a, \hat{\theta}+b]]=95 \%
$$

## Confidence interval

## Confidence region

## Principles for deriving Cls

If $X_{1}, X_{2}, \ldots, X_{n}$ is a random sample from a distribution $f(x, \theta)$, then

- Find a random variable $Y=h\left(X_{1}, X_{2}, \ldots, X_{n} ; \theta\right)$ such that the probability distribution of $Y$ does not depend on $\theta$ or on any other unknown parameters.
- Find constants $a, b$ such that

$$
P\left[a<h\left(X_{1}, X_{2}, \ldots, X_{n} ; \theta\right)<b\right]=0.95
$$

- Manipulate these inequality to isolate $\theta$

$$
P\left[\ell\left(X_{1}, X_{2}, \ldots, X_{n}\right)<\theta<u\left(X_{1}, X_{2}, \ldots, X_{n}\right)\right]=0.95
$$

## Confidence interval: example

## Problem

Suppose the sediment density ( $\mathrm{g} / \mathrm{cm}$ ) of a randomly selected specimen from a certain region is normally distributed with mean $\mu$ and standard deviation 0.85 .
If a random sample of 25 specimens is selected, with sample average $\bar{X}$.

- Find a number a such that

$$
P[-a<\bar{X}-\mu<a]=0.95
$$

## Confidence interval: example

## Problem

Suppose the sediment density ( $\mathrm{g} / \mathrm{cm}$ ) of a randomly selected specimen from a certain region is normally distributed with mean $\mu$ and standard deviation 0.85 .

- If a random sample of 25 specimens is selected, with sample average $\bar{X}$. Find a such that

$$
P[-a<\bar{X}-\mu<a]=0.95
$$

If $\bar{x}=2.65$, then we know with confidence $95 \%$ that

$$
\mu \in(2.65-a, 2.65+a)
$$

$\rightarrow$ This is a confidence interval for the population mean $\mu$

## One-sided confidence interval

## Problem

Suppose the sediment density ( $\mathrm{g} / \mathrm{cm}$ ) of a randomly selected specimen from a certain region is normally distributed with mean $\mu$ and standard deviation 0.85 .
If a random sample of 25 specimens is selected, with sample average $\bar{X}$. Find a number $b$ such that

$$
P[\bar{X}<b]=0.95
$$

## 95\% confidence interval

- Assumptions:
- Normal distribution
- $\sigma$ is known
- $95 \%$ confidence interval

If after observing $X_{1}=x_{1}, X_{2}=x_{2}, \ldots, X_{n}=x_{n}$, we compute the observed sample mean $\bar{x}$. Then

$$
\left(\bar{x}-1.96 \frac{\sigma}{\sqrt{n}}, \bar{x}+1.96 \frac{\sigma}{\sqrt{n}}\right)
$$

is a $95 \%$ confidence interval of $\mu$

## Assumptions

- Section 8.1
- Normal distribution
- $\sigma$ is known
- Section 8.2
- Normal distribution
- $\sigma$ is known
$\rightarrow$ Using Central Limit Theorem $\rightarrow$ needs $n>30$
- Section 8.3
- Normal distribution
- $\sigma$ is known
$\rightarrow$ Introducing $t$-distribution

## Other levels of confidence

## Problem

Suppose the sediment density ( $\mathrm{g} / \mathrm{cm}$ ) of a randomly selected specimen from a certain region is normally distributed with mean $\mu$ and standard deviation 0.85 .
If a random sample of 25 specimens is selected, with sample average $\bar{x}=2.65$.
Find the confidence interval with confidence level $99 \%$.
Hint: Find the number a such that

$$
P[-a<\bar{X}-\mu<a]=0.99
$$

## $100(1-\alpha) \%$ confidence interval

Mathematical statistics

## $100(1-\alpha) \%$ confidence interval

A $100(1-\alpha) \%$ confidence interval for the mean $\mu$ of a normal population when the value of $\sigma$ is known is given by

$$
\begin{equation*}
\left(\bar{x}-z_{\alpha / 2} \cdot \frac{\sigma}{\sqrt{n}}, \bar{x}+z_{\alpha / 2} \cdot \frac{\sigma}{\sqrt{n}}\right) \tag{8.5}
\end{equation*}
$$

or, equivalently, by $\bar{x} \pm z_{\alpha / 2} \cdot \sigma / \sqrt{n}$.

## Choices of sample size

## Problem

Let $X_{1}, X_{2}, \ldots, X_{n}$ is a sample from a normal distribution with $\sigma=25$, what sample size $n$ is necessary to ensure that the resulting $95 \%$ Cl has a width of (at most) 10?

## Choices of sample size

Figure 8.4 $P\left(-z_{\alpha / 2} \leq Z \leq z_{\alpha / 2}\right)=1-\alpha$

$$
n=\left(z_{\alpha / 2} \frac{\sigma}{\text { width }}\right)^{2}
$$

## Interpreting confidence interval

95\% confidence interval: If we repeat the experiment many times, the interval contains $\mu$ about $95 \%$ of the time

## How NOT to interpret confidence interval

- Writing

$$
P[\mu \in(\bar{X}-1.7, \bar{X}+1.7)]=95 \%
$$

is okay.

- If $\bar{x}=2.7$, writing

$$
P[\mu \in(1,5.4)]=95 \%
$$

is NOT okay.

- Saying $\mu \in(1,5.4)$ with confidence level $95 \%$ is okay.
- Saying "if we repeat the experiment many times, the interval contains $\mu$ about $95 \%$ of the time" is perfect.
