

Quiz 5

For many calculus instructors it seems that students taking Calculus I in the fall semester are better prepared than are the students taking it in the spring. A study is conducted, for which ACT mathematics scores for the fall and spring students are collected.

The collected data is as follows. For fall semester, $m = 80$ scores are recorded, with sample mean 28.25 and sample standard deviation 6.5. For spring semester, $n = 74$ scores are recorded, with sample mean 25.88 and sample standard deviation 9.18.

At $\alpha = 5\%$ level of significant, investigate whether there is enough evidence to conclude that that students taking Calculus I in the fall semester are better prepared than are the students taking it in the spring. Provide the p-value of the test.

z-table

Table A.3 Standard Normal Curve Areas (cont.)

$\Phi(z) = P(Z \leq z)$
