## 7.1 Point estimate

- unbiased estimator
- mean squared error

## 7.2 Methods of point estimation

- method of moments
- method of maximum likelihood.

## 7.3 Sufficient statistic

## 7.4 Information and Efficiency

- Large sample properties of the maximum likelihood estimator

## Definition

A point estimate  $\hat{\theta}$  of a parameter  $\theta$  is a single number that can be regarded as a sensible value for  $\theta$ .

population parameter  $\implies$  *sample*  $\implies$  *estimator*  
 $\theta \implies X_1, X_2, \dots, X_n \implies \hat{\theta}$

# Estimate vs estimator

*sample*  $\implies$  *estimator*

$$X_1, X_2, \dots, X_n \implies \hat{\theta}$$

*observed data*  $\implies$  *estimate*

$$x_1, x_2, \dots, x_n \implies \hat{\theta}$$

# Mean Squared Error

- Measuring error of estimation

$$|\hat{\theta} - \theta| \quad \text{or} \quad (\hat{\theta} - \theta)^2$$

- The error of estimation is random

## Definition

The mean squared error of an estimator  $\hat{\theta}$  is

$$E[(\hat{\theta} - \theta)^2]$$

## Theorem

$$MSE(\hat{\theta}) = E[(\hat{\theta} - \theta)^2] = V(\hat{\theta}) + (E(\hat{\theta}) - \theta)^2$$

## Bias-variance decomposition

Mean squared error = variance of estimator + (*bias*)<sup>2</sup>

## Definition

A point estimator  $\hat{\theta}$  is said to be an unbiased estimator of  $\theta$  if

$$E(\hat{\theta}) = \theta$$

for every possible value of  $\theta$ .

Unbiased estimator

$\Leftrightarrow$  Bias = 0

$\Leftrightarrow$  Mean squared error = variance of estimator

## Method of moments

- Let  $X_1, \dots, X_n$  be a random sample from a normal distribution with pmf or pdf  $f(x)$ .
- For  $k = 1, 2, 3, \dots$ , the  $k^{\text{th}}$  population moment, or  $k^{\text{th}}$  moment of the distribution  $f(x)$ , is

$$E(X^k)$$

- First moment: the mean
- Second moment:  $E(X^2)$

# Sample moments

- Let  $X_1, \dots, X_n$  be a random sample from a distribution with pmf or pdf  $f(x)$ .
- For  $k = 1, 2, 3, \dots$ , the  $k^{\text{th}}$  sample moment is

$$\frac{X_1^k + X_2^k + \dots + X_n^k}{n}$$

The law of large numbers provides that when  $n \rightarrow \infty$

$$\frac{X_1^k + X_2^k + \dots + X_n^k}{n} \rightarrow E(X^k)$$

# Method of moments: ideas

- Let  $X_1, \dots, X_n$  be a random sample from a distribution with pmf or pdf

$$f(x; \theta_1, \theta_2, \dots, \theta_m)$$

- Assume that for  $k = 1, \dots, m$

$$\hat{u}_k = \frac{X_1^k + X_2^k + \dots + X_n^k}{n} = E(X^k)$$

- Solve the system of equations for  $\theta_1, \theta_2, \dots, \theta_m$

## Method of maximum likelihood

# Joint distribution of a random sample

Let  $X_1, X_2, \dots, X_n$  be a random sample of size  $n$  from a distribution with density function  $f_X(x)$ .

Then the density of the joint distribution of  $(X_1, X_2, \dots, X_n)$  is

$$f_{joint}(x_1, x_2, \dots, x_n) = \prod_{i=1}^n f_X(x_i)$$

# Maximum likelihood estimator

- Let  $X_1, X_2, \dots, X_n$  have joint pmf or pdf

$$f_{joint}(x_1, x_2, \dots, x_n; \theta)$$

where  $\theta$  is unknown.

- When  $x_1, \dots, x_n$  are the observed sample values and this expression is regarded as a function of  $\theta$ , it is called the **likelihood function**.
- The maximum likelihood estimates  $\theta_{ML}$  are the value for  $\theta$  that **maximize the likelihood function**:

$$f_{joint}(x_1, x_2, \dots, x_n; \theta_{ML}) \geq f_{joint}(x_1, x_2, \dots, x_n; \theta) \quad \forall \theta$$

# How to find the MLE?

- Step 1: Write down the likelihood function.
- Step 2: Taking the logarithm of this function.
- Step 3: Find the maximum of this new function.
  - compute the derivative of the function with respect to  $\theta$
  - set this expression of the derivative to 0
  - solve the equation

# Example 1

## Problem

Let  $X_1, \dots, X_{10}$  be a random sample from the exponential distribution with parameter  $\lambda$ , that is

$$f(x; \lambda) = \lambda e^{-\lambda x}, \quad x \geq 0$$

The observed data are

3.11, 0.64, 2.55, 2.20, 5.44,

3.42, 1.39, 8.13, 1.82, 1.30

Use the method of maximum likelihood to obtain an estimator of  $\lambda$ .

## Example 2

### Problem

Let  $X_1, \dots, X_{10}$  be a random sample from a distribution with pdf

$$f(x) = \begin{cases} (\theta + 1)x^\theta & \text{if } 0 \leq x \leq 1 \\ 0 & \text{otherwise} \end{cases}$$

A random sample of ten students yields data

$$x_1 = .92, x_2 = .79, x_3 = .90, x_4 = .65, x_5 = .86,$$

$$x_6 = .47, x_7 = .73, x_8 = .97, x_9 = .94, x_{10} = .77$$

Use the method of maximum likelihood to obtain an estimator of  $\theta$ .

## Example 3

### Problem

Let  $\beta > 1$  and  $X_1, \dots, X_n$  be a random sample from a distribution with pdf

$$f(x) = \begin{cases} \frac{\beta}{x^{\beta+1}} & \text{if } x > 1 \\ 0 & \text{otherwise} \end{cases}$$

Use the method of maximum likelihood to obtain an estimator of  $\beta$ .

## Example 4

### Problem

Let  $X_1, \dots, X_n$  be a random sample from the normal distribution  $\mathcal{N}(0, \sigma^2)$ , that is

$$f(x, \theta) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{x^2}{2\sigma^2}}$$

Use the method of maximum likelihood to obtain an estimator of  $\sigma$ .

Connecting everything

## Example 5

### Problem

Consider a random sample  $X_1, \dots, X_n$  from the pdf

$$f(x) = \frac{1 + \theta x}{2} \quad -1 \leq x \leq 1$$

- Construct an estimator of  $\theta$  by the method of moments.
- Prove that this estimator is unbiased

## Example 6

### Problem

Let  $0 < \theta < \infty$  and  $X_1, X_2, \dots, X_n$  sample from a distribution with density function

$$f(x; \theta) = \frac{1}{\theta}, \quad 0 \leq x \leq \theta.$$

- Construct an estimator of  $\theta$  by the method of moments.
- Compute the mean squared error (MSE) of this estimator.

# Example 7

## Problem

Let  $X_1, X_2, \dots, X_n$  represent a random sample from a distribution with pdf

$$f(x, \theta) = \frac{2x}{\theta + 1} e^{-x^2/(\theta+1)}, \quad x > 0$$

- Derive the maximum-likelihood estimator for parameter  $\theta$
- Given that

$$E(X^2 - 1) = \theta,$$

construct an estimator of  $\theta$  based on the method of moments.
