## 8.1 Basic properties of confidence intervals (CIs)

- Interpreting CIs
- General principles to derive CI

## 8.2 Large-sample confidence intervals for a population mean

- Using the Central Limit Theorem to derive CIs

## 8.3 Intervals based on normal distribution

- Using Student's t-distribution

## 8.4 CIs for standard deviation

# Confidence intervals for a population mean

- Section 8.1: Normal distribution with known  $\sigma$ 
    - Normal distribution
    - $\sigma$  is known
  - Section 8.2: Large-sample confidence intervals
    - Normal distribution
      - use Central Limit Theorem → needs  $n > 30$
    - $\sigma$  is known
      - replace  $\sigma$  by  $s$  → needs  $n > 40$
  - Section 8.3: Intervals based on normal distributions
    - Normal distribution
    - $\sigma$  is known
- Introducing  $t$ -distribution

## 8.1: Normal distribution with known $\sigma$

## 8.1: Normal distribution with known $\sigma$

- Assumptions:
  - Normal distribution
  - $\sigma$  is known
- 95% confidence interval

If after observing  $X_1 = x_1, X_2 = x_2, \dots, X_n = x_n$ , we compute the observed sample mean  $\bar{x}$ . Then

$$\left( \bar{x} - 1.96 \frac{\sigma}{\sqrt{n}}, \bar{x} + 1.96 \frac{\sigma}{\sqrt{n}} \right)$$

is a 95% confidence interval of  $\mu$

# z-critical value

## NOTATION

$z_\alpha$  will denote the value on the measurement axis for which  $\alpha$  of the area under the  $z$  curve lies to the right of  $z_\alpha$ . (See Figure 4.19.)

For example,  $z_{.10}$  captures upper-tail area .10 and  $z_{.01}$  captures upper-tail area .01.

Figure 4.19  $z_\alpha$  notation illustrated

Since  $\alpha$  of the area under the standard normal curve lies to the right of  $z_\alpha$ ,  $1 - \alpha$  of the area lies to the left of  $z_\alpha$ . Thus  $z_\alpha$  is the  $100(1 - \alpha)$ th percentile of the standard normal distribution. By symmetry the area under the standard normal curve to the left of  $-z_\alpha$  is also  $\alpha$ . The  $z_\alpha$ 's are usually referred to as **z critical values**. Table 4.1 lists the most useful standard normal percentiles and  $z_\alpha$  values.

# $100(1 - \alpha)\%$ confidence interval

A  **$100(1 - \alpha)\%$  confidence interval** for the mean  $\mu$  of a normal population when the value of  $\sigma$  is known is given by

$$\left( \bar{x} - z_{\alpha/2} \cdot \frac{\sigma}{\sqrt{n}}, \bar{x} + z_{\alpha/2} \cdot \frac{\sigma}{\sqrt{n}} \right) \quad (8.5)$$

or, equivalently, by  $\bar{x} \pm z_{\alpha/2} \cdot \sigma / \sqrt{n}$ .

## 8.2: Large-sample CIs of the population mean

- Central Limit Theorem

$$\frac{\bar{X} - \mu}{\sigma/\sqrt{n}}$$

is approximately normal when  $n > 30$

- Moreover, when  $n$  is sufficiently large  $s \approx \sigma$
- Conclusion:

$$\frac{\bar{X} - \mu}{s/\sqrt{n}}$$

is approximately normal when  $n$  is sufficiently large

**If  $n > 40$ , we can ignore the normal assumption and replace  $\sigma$  by  $s$**

# $100(1 - \alpha)\%$ confidence interval

If after observing  $X_1 = x_1, X_2 = x_2, \dots, X_n = x_n$  ( $n > 40$ ), we compute the observed sample mean  $\bar{x}$  and sample standard deviation  $s$ . Then

$$\left( \bar{x} - z_{\alpha/2} \frac{s}{\sqrt{n}}, \bar{x} + z_{\alpha/2} \frac{s}{\sqrt{n}} \right)$$

is a 95% confidence interval of  $\mu$

**A large-sample upper confidence bound for  $\mu$  is**

$$\mu < \bar{x} + z_{\alpha} \cdot \frac{s}{\sqrt{n}}$$

**and a large-sample lower confidence bound for  $\mu$  is**

$$\mu > \bar{x} - z_{\alpha} \cdot \frac{s}{\sqrt{n}}$$

## 8.3: Intervals based on normal distributions

- the population of interest is normal  
(i.e.,  $X_1, \dots, X_n$  constitutes a random sample from a normal distribution  $\mathcal{N}(\mu, \sigma^2)$ ).
- $\sigma$  is unknown

→ we want to consider cases when  $n$  is small.

When  $\bar{X}$  is the mean of a random sample of size  $n$  from a normal distribution with mean  $\mu$ , the rv

$$\frac{\bar{X} - \mu}{S/\sqrt{n}}$$

has the  $t$  distribution with  $n - 1$  degree of freedom (df).

# Confidence intervals

Let  $\bar{x}$  and  $s$  be the sample mean and sample standard deviation computed from the results of a random sample from a normal population with mean  $\mu$ . Then a **100(1 -  $\alpha$ )% confidence interval for  $\mu$ , the one-sample  $t$  CI**, is

$$\left( \bar{x} - t_{\alpha/2, n-1} \cdot \frac{s}{\sqrt{n}}, \bar{x} + t_{\alpha/2, n-1} \cdot \frac{s}{\sqrt{n}} \right) \quad (8.15)$$

or, more compactly,  $\bar{x} \pm t_{\alpha/2, n-1} \cdot s/\sqrt{n}$ .

An **upper confidence bound for  $\mu$**  is

$$\bar{x} + t_{\alpha, n-1} \cdot \frac{s}{\sqrt{n}}$$

and replacing + by - in this latter expression gives a **lower confidence bound for  $\mu$** ; both have confidence level 100(1 -  $\alpha$ )%.

# $t$ distributions

Let  $t_{\alpha, \nu}$  = the number on the measurement axis for which the area under the  $t$  curve with  $\nu$  df to the right of  $t_{\alpha, \nu}$ , is  $\alpha$ ;  $t_{\alpha, \nu}$  is called a  **$t$  critical value**.

Figure 8.7 A pictorial definition of  $t_{\alpha, \nu}$

**Table A.5** Critical Values for t Distributions

$\nu$	$\alpha$						
	.10	.05	.025	.01	.005	.001	.0005
1	3.078	6.314	12.706	31.821	63.657	318.31	636.62
2	1.886	2.920	4.303	6.965	9.925	22.326	31.598
3	1.638	2.353	3.182	4.541	5.841	10.213	12.924

20	1.325	1.725	2.086	2.528	2.845	3.552	3.850
21	1.323	1.721	2.080	2.518	2.831	3.527	3.819
22	1.321	1.717	2.074	2.508	2.819	3.505	3.792
23	1.319	1.714	2.069	2.500	2.807	3.485	3.767
24	1.318	1.711	2.064	2.492	2.797	3.467	3.745

## Prediction intervals

- We have available a random sample  $X_1, X_2, \dots, X_n$  from a normal population distribution
- We wish to predict the value of  $X_{n+1}$ , a single future observation.

This is a much more difficult problem than the problem of estimating  $\mu$

- When  $n \rightarrow \infty$ ,  $\bar{X} \rightarrow \mu$
- Even when we know  $\mu$ ,  $X_{n+1}$  is still random

Let  $X_1, X_2, \dots, X_n$  be a sample from a normal population distribution  $\mathcal{N}(\mu, \sigma)$  and  $X_{n+1}$  be an independent sample from the same distribution.

- Compute  $E[\bar{X} - X_{n+1}]$  in terms of  $\mu, \sigma, n$
- Compute  $Var[\bar{X} - X_{n+1}]$  in terms of  $\mu, \sigma, n$
- What is the distribution of  $\bar{X} - X_{n+1}$ ?

If  $\sigma$  is known

$$\frac{\bar{X} - X_{n+1}}{\sigma \sqrt{1 + \frac{1}{n}}}$$

follows the standard normal distribution  $\mathcal{N}(0, 1)$ .

$$T = \frac{\bar{X} - X_{n+1}}{S\sqrt{1 + \frac{1}{n}}} \sim t \text{ distribution with } n - 1 \text{ df}$$

A **prediction interval (PI)** for a single observation to be selected from a normal population distribution is

$$\bar{x} \pm t_{\alpha/2, n-1} \cdot s \sqrt{1 + \frac{1}{n}} \quad (8.16)$$

The *prediction level* is  $100(1 - \alpha)\%$ .

## Example 4b

### Example

Let  $X$  be the amount of butterfat in pounds produced by a typical cow during a 305-day milk production period between her first and second calves. Assume that the distribution of  $X$  is  $N(\mu, \sigma^2)$ . To estimate  $\mu$ , a farmer measured the butterfat production for  $n = 20$  cows and obtained the following data:

481	537	513	583	453	510	570	500	457	555
618	327	350	643	499	421	505	637	599	392

Construct a 90% prediction interval for  $\mu$ .

## Section 6.4: Distributions based on a normal random sample

- The Chi-squared distribution
- The  $t$  distribution
- The  $F$  Distribution

# Chi-squared distribution

The pdf of a Chi-squared distribution with degree of freedom  $\nu$ , denoted by  $\chi_\nu^2$ , is

$$f(x) = \begin{cases} \frac{1}{2^{1/2}\Gamma(\nu/2)} x^{(\nu/2)-1} e^{-x/2} & x > 0 \\ 0 & x \leq 0 \end{cases}$$

# Why is Chi-squared useful?

## Proposition

*If  $Z$  has standard normal distribution  $\mathcal{Z}(0, 1)$  and  $X = Z^2$ , then  $X$  has Chi-squared distribution with 1 degree of freedom, i.e.  $X \sim \chi_1^2$  distribution.*

## Proposition

*If  $X_1 \sim \chi_{\nu_1}^2$ ,  $X_2 \sim \chi_{\nu_2}^2$  and they are independent, then*

$$X_1 + X_2 \sim \chi_{\nu_1 + \nu_2}^2$$

# Why is Chi-squared useful?

## Proposition

*If  $Z_1, Z_2, \dots, Z_n$  are independent and each has the standard normal distribution, then*

$$Z_1^2 + Z_2^2 + \dots + Z_n^2 \sim \chi_n^2$$

# Why is Chi-squared useful?

If  $X_1, X_2, \dots, X_n$  is a random sample from the normal distribution  $\mathcal{N}(\mu, \sigma^2)$ , then

$$(n-1) \frac{S^2}{\sigma^2} \sim \chi_{n-1}^2$$

Let  $Z$  be a standard normal rv and let  $X$  be a  $\chi^2_\nu$  rv independent of  $Z$ . Then the  $t$  distribution with degrees of freedom  $\nu$  is defined to be the distribution of the ratio

$$T = \frac{Z}{\sqrt{X/\nu}}$$

# $t$ distributions

When  $\bar{X}$  is the mean of a random sample of size  $n$  from a normal distribution with mean  $\mu$ , the rv

$$\frac{\bar{X} - \mu}{S/\sqrt{n}}$$

has the  $t$  distribution with  $n - 1$  degree of freedom (df).

Hint:

$$T = \frac{Z}{\sqrt{X/\nu}} \quad (n-1) \frac{S^2}{\sigma^2} \sim \chi_{n-1}^2$$

and

$$\frac{\bar{X} - \mu}{S/\sqrt{n}} = \frac{\bar{X} - \mu}{\sigma/\sqrt{n}} \cdot \frac{1}{\sqrt{(n-1)S^2/\sigma^2/(n-1)}}$$

## CIs for variance and standard deviation

# Why is Chi-squared useful?

If  $X_1, X_2, \dots, X_n$  is a random sample from the normal distribution  $\mathcal{N}(\mu, \sigma^2)$ , then

$$(n-1) \frac{S^2}{\sigma^2} \sim \chi_{n-1}^2$$

# Important: Chi-squared distribution are not symmetric

# CIs for standard deviation

We have

$$P\left(\chi_{1-\alpha/2, n-1}^2 < \frac{(n-1)S^2}{\sigma^2} < \chi_{\alpha/2, n-1}^2\right) = 1 - \alpha$$

Play around with these inequalities:

$$\frac{(n-1)S^2}{\chi_{\alpha/2, n-1}^2} < \sigma^2 < \frac{(n-1)S^2}{\chi_{1-\alpha/2, n-1}^2}$$

A **100(1 -  $\alpha$ )% confidence interval for the variance  $\sigma^2$  of a normal population** has lower limit

$$(n - 1)s^2 / \chi_{\alpha/2, n-1}^2$$

and upper limit

$$(n - 1)s^2 / \chi_{1-\alpha/2, n-1}^2$$

A **confidence interval for  $\sigma$**  has lower and upper limits that are the square roots of the corresponding limits in the interval for  $\sigma^2$ .

## Practice problems

# Example 1

## Problem

*Here are the alcohol percentages for a sample of 16 beers:*

4.68	4.13	4.80	4.63	5.08	5.79	6.29	6.79
4.93	4.25	5.70	4.74	5.88	6.77	6.04	4.95

*(a) Assume the distribution is normal, construct the 95% confidence interval for the population mean.*

**Table A.5** Critical Values for t Distributions

$\nu$	$\alpha$						
	.10	.05	.025	.01	.005	.001	.0005
1	3.078	6.314	12.706	31.821	63.657	318.31	636.62
2	1.886	2.920	4.303	6.965	9.925	22.326	31.598
3	1.638	2.353	3.182	4.541	5.841	10.213	12.924
4	1.533	2.132	2.776	3.747	4.604	7.173	8.610
5	1.476	2.015	2.571	3.365	4.032	5.893	6.869
6	1.440	1.943	2.447	3.143	3.707	5.208	5.959
7	1.415	1.895	2.365	2.998	3.499	4.785	5.408
8	1.397	1.860	2.306	2.896	3.355	4.501	5.041
9	1.383	1.833	2.262	2.821	3.250	4.297	4.781
10	1.372	1.812	2.228	2.764	3.169	4.144	4.587
11	1.363	1.796	2.201	2.718	3.106	4.025	4.437
12	1.356	1.782	2.179	2.681	3.055	3.930	4.318
13	1.350	1.771	2.160	2.650	3.012	3.852	4.221
14	1.345	1.761	2.145	2.624	2.977	3.787	4.140
15	1.341	1.753	2.131	2.602	2.947	3.733	4.073
16	1.337	1.746	2.120	2.583	2.921	3.686	4.015
17	1.333	1.740	2.110	2.567	2.898	3.646	3.965
18	1.330	1.734	2.101	2.552	2.878	3.610	3.922
19	1.328	1.729	2.093	2.539	2.861	3.579	3.883
20	1.325	1.725	2.086	2.528	2.845	3.552	3.850
21	1.323	1.721	2.080	2.518	2.831	3.527	3.819
22	1.321	1.717	2.074	2.508	2.819	3.505	3.792
23	1.319	1.714	2.069	2.500	2.807	3.485	3.767
24	1.318	1.711	2.064	2.492	2.797	3.467	3.745

# Example 1b

## Problem

*Here are the alcohol percentages for a sample of 16 beers:*

4.68	4.13	4.80	4.63	5.08	5.79	6.29	6.79
4.93	4.25	5.70	4.74	5.88	6.77	6.04	4.95

*(b) Assume the distribution is normal, construct the 95% lower confidence bound for the population mean.*

## Example 1c

### Problem

*Here are the alcohol percentages for a sample of 16 beers:*

4.68	4.13	4.80	4.63	5.08	5.79	6.29	6.79
4.93	4.25	5.70	4.74	5.88	6.77	6.04	4.95

*(b) Assume that another beer is sampled from the same distribution, construct the 95% prediction interval for the alcohol percentages of that beer.*

## Example 2

### Problem

*Suppose that against a certain opponent, the number of points a basketball team scores is normally distributed with unknown mean  $\mu$  and unknown variance  $\sigma^2$ . Suppose that over the course of the last 10 games, the team scored the following points:*

59, 62, 59, 74, 70, 61, 62, 66, 62, 75

- *Construct a 95% confidence interval for  $\mu$ .*
- *Now suppose that you learn that  $\sigma^2 = 25$ . Construct a 95% confidence interval for  $\mu$ . How does this compare to the interval in (a)?*

## Example 3

### Problem

*A study of the ability of individuals to walk in a straight line reported the accompanying data on cadence (strides per second) for a sample of  $n = 20$  randomly selected healthy men. Assuming that the distribution is normal:*

- *Calculate a 95% confidence interval for population mean cadence*
- *Calculate and interpret a 95% prediction interval for the cadence of a single individual randomly selected from this population.*
