

MATH 205: Statistical methods

October 11th, 2021

Lecture 11: Uniform and normal distributions

Announcements

- Homework 3 was uploaded to the course webpage, due next Wednesday
- There will be a quiz in class next Monday. The quiz covers the materials of Chapter 4.
- Countdown to midterm exam (written part): 16 days. The exam covers everything up to Chapter 6.
- Countdown to midterm exam (simulations): 14 days (050L) or 16 days (051L). The exam covers everything up Central Limit Theorem.

Revised schedule

Date	Theme/Topic	Labs	Assignments
Sep 1	Syllabus		
Sep 8	Chapter 1: Describing dataset	Section 2: Handling data	
Sep 13 - 15	Chapter 2: Looking at Relationships	Section 3: Univariate data	
Sep 20-22	Chapter 3: Basic Ideas in Probability	Section 4: Bivariate Data	
Sep 27-29	Chapters 3-4	Random data	Homework 1 (due 09/22)
Oct 4-6	Chapter 4: Random variables and expectations	Random continuous data	Homework 2 (due 10/06)
Oct 11-13	Chapter 5: Useful distributions	Section 7: The central limit theorem	
Oct 18-20	Chapter 6: Samples and populations	Section 9: Confidence interval estimation	Homework 3 (due 10/20)
Oct 25-27	Review and midterm exam		Midterm: Oct 27 (lecture), Oct 25-27 (labs)
Nov 1-3	Chapter 7: The significance of evidence	Section 10: Hypothesis testing	
Nov 8-10	Goodness of Fit	Section 12: Goodness of Fit	Homework 4 (due 11/10)
Nov 15-17	Linear Regression	Section 13: Linear regression	
Nov 22-24	Thanksgiving break		
Nov 29 - Dec 1	One-Way Analysis of Variance	Section 15: Analysis of variance	Homework 5 (due 12/01)
Dec 6-8	Selected topics + Review		
Exam week			

Review: Random variables and expectations

Random variables and expectations

4.1 Random variables

4.2 Expectations

- Expected values
- Mean, variance and covariance

Random variables

Notations:

- random variables are denoted by uppercase letters (e.g., X);
- the observed values of the random variables are denoted by lowercase letters (e.g., x)

Random variables

- Discrete

x	1	2	3	4	5	6	7
$p(x)$.01	.03	.13	.25	.39	.17	.02

- Continuous

Figure 4.2 $P(a \leq X \leq b) =$ the area under the density curve between a and b

Expected value: discrete variables

Definition

Given a discrete random variable X which takes values in the set \mathcal{D} and which has probability distribution P :

- The expected value of X is defined as

$$\mathbb{E}[X] = \sum_{x \in \mathcal{D}} xP(X = x)$$

- $f(X)$ is a also discrete random variable, which we write F and

$$\mathbb{E}[f(X)] = \sum_{u \in \mathcal{D}_f} uP(F = u) = \sum_{x \in \mathcal{D}} f(x)P(X = x)$$

which is sometimes referred to as “the expectation of f ”.

Expected value: continuous variables

Definition

Given a discrete random variable X which takes values in the set \mathcal{D} and which has probability density function $p(x)$:

- The expected value of X is defined as

$$\mathbb{E}[X] = \int_{\mathcal{D}} xp(x) dx$$

- $f(X)$ is also a continuous random variable, which we write F and

$$\mathbb{E}[f(X)] = \int_{\mathcal{D}} f(x)p(x) dx$$

which is sometimes referred to as “the expectation of f ”

Mean and variance

Definition

- The mean or expected value of a random variable X is

$$\mathbb{E}[X]$$

- The variance of a random variable X is

$$\text{var}[X] = \mathbb{E}[(X - \mathbb{E}[X])^2]$$

- The standard deviation of a random variable X is defined as

$$\text{std}(X) = \sqrt{\text{var}(X)}$$

Expectations are linear

Useful Facts 4.2 (Expectations Are Linear)

Write f, g for functions of random variables.

- $\mathbb{E}[0] = 0$
- for any constant k , $\mathbb{E}[kf] = k\mathbb{E}[f]$
- $\mathbb{E}[f + g] = \mathbb{E}[f] + \mathbb{E}[g]$.

Properties of variance

Lemma

We have

- *For any constant k , $\text{var}[k] = 0$;*
- *$\text{var}[X] \geq 0$;*
- *$\text{var}[kX] = k^2 \text{var}[X]$*

The variance of a random variable X can be computed by

$$\text{var}[X] = \mathbb{E}[X^2] - (\mathbb{E}[X])^2$$

Covariance

Definition

The covariance of two random variables X and Y is

$$\text{cov}(X, Y) = \mathbb{E}[(X - \mathbb{E}[X])(Y - \mathbb{E}[Y])]$$

The covariance of two random variables X and Y can be computed as

$$\text{cov}(X, Y) = \mathbb{E}[XY] - \mathbb{E}[X]\mathbb{E}[Y]$$

Independent variables have zero covariance

Proposition

If X and Y are independent, then

- $\mathbb{E}[XY] = \mathbb{E}[X]\mathbb{E}[Y]$
- $\text{cov}(X, Y) = 0$
- $\text{var}(X + Y) = \text{var}(X) + \text{var}(Y)$

Example

Example

Assume that the joint probability of X (receive values 1, 2) and Y (receives values 1, 2, 3) is represented by the following table

$X \backslash Y$	1	2	3
1	0.14	0.42	0.06
2	0.06	0.28	0.04

Compute $\text{Cov}(X, Y)$.

Chapter 5: Useful distributions

The Discrete Uniform Distribution

Definition

A random variable has the discrete uniform distribution if it takes each of k values with the same probability $1/k$, and all other values with probability zero.

Problem

Consider a random variable X that follows discrete uniform distribution on the set $\{1, 2, 3, 4\}$.

Compute $E(X)$ and $\text{Var}(X)$.

The continuous uniform distribution

Definition

Write l for the lower bound and u for the upper bound. The probability density function for the uniform distribution on the interval l, u is

$$f(x) = \begin{cases} \frac{1}{u-l}, & x \in [l, u] \\ 0 & \textit{otherwise} \end{cases}$$

Problem

Consider a random variable X that follows continuous uniform distribution on $[l, u]$.

Compute $E(X)$ and $\text{Var}(X)$ (in terms of l, u).

The standard normal distribution

Definition

The probability density function

$$p(x) = \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}$$

is known as the standard normal distribution.

The standard normal distribution has mean 0 and variance 1.

Normal distributions

Write μ for the mean of a random variable X and σ for its standard deviation; if

$$\frac{X - \mu}{\sigma}$$

has a standard normal distribution, then X is a normal random variable.

Definition

The probability density function

$$p(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

is a normal distribution.

Normal distributions

Definition

If X a normal random variable with probability density function

$$p(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}.$$

then

$$E[X] = \mu, \quad \text{Var}(X) = \sigma^2$$

$$\mathcal{N}(\mu, \sigma^2)$$

$$E(X) = \mu, \text{Var}(X) = \sigma^2$$

Normal distributions

Questions: If the normal distributions are so complicated, how can we compute probability associated with normal random variables?

Review: Distribution function

Definition

If X is a random variable, then the function F defined on $(-\infty, \infty)$ by

$$F(t) = P(X \leq t)$$

is called the distribution function of X .

Distribution function

For continuous random variable:

$$P(a \leq X \leq b) = \int_a^b f(x) dx = F(b) - F(a)$$

Figure 4.2 $P(a \leq X \leq b)$ = the area under the density curve between a and b

$\Phi(z)$: Distribution function of standard normal

$$\Phi(z) = P(Z \leq z) = \int_{-\infty}^z f(y) dy$$

$$\Phi(z)$$

Table A.3 Standard Normal Curve Areas (cont.)

$$\Phi(z) = P(Z \leq z)$$

Exercise 1

Problem

Let Z be a standard normal random variable.

Compute

- $P[Z \leq 0.75]$
- $P[Z \geq 0.82]$
- $P[1 \leq Z \leq 1.96]$

Note: The density function of Z is symmetric around 0.
