Random variables

Notations:

- random variables are denoted by uppercase letters (e.g., X);
- the observed values of the random variables are denoted by lowercase letters (e.g., x)

Discrete random variable

A random variables X is discrete if the set of all possible values of X

- is finite
- is countably infinite

A random variables is characterized by its probability mass function, usually represented as a table

x	1	2	3	4	5	6	7	
p(x)	.01	.03	.13	.25	.39	.17	.02

Continuous random variables

Definition

Let X be a random variable. Suppose that there exists a nonnegative real-valued function $f : \mathbb{R} \to [0, \infty)$ such that for any subset of real numbers A, we have

$$P(X \in A) = \int_A f(x) dx$$

Then X is called **continuous**. The function f is called the **probability density function**, or simply the **density function** of X.

Properties

Let X be a continuous r.v. with density function f, then

- $f(x) \ge 0$ for all $x \in \mathbb{R}$
- $\int_{-\infty}^{\infty} f(x) dx = 1$
- For any fixed constant a, b,

$$P(a \le X \le b) = \int_a^b f(x) \ dx$$

Figure 4.2 $P(a \le X \le b)$ = the area under the density curve between a and b

Distribution function

Definition

If X is a random variable, then the function F defined on $(-\infty,\infty)$ by

$$F(t) = P(X \le t) = \int_{(-\infty,t]} f(x) dx$$
$$= \int_{-\infty}^{t} f(x) dx$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

is called the distribution function of X.

Example

Problem

Let X be a continuous r.v. with density function

$$f(x) = egin{cases} 2x & \textit{if } x \in [0,1] \ 0 & \textit{otherwise} \end{cases}$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

Compute

•
$$P[X \le -1]$$

- $P[X \le 0.5]$
- $P[X \le 1.5]$

Example

Problem

Let X be a continuous r.v. with density function

$$f(x) = egin{cases} 2x & \textit{if } x \in [0,1] \ 0 & \textit{otherwise} \end{cases}$$

 Let t be a number such that 0 < t < 1, compute P[X ≤ t] (the result should be a function of t)

• Find t such that $P[X \le t] = 1/2$

Distribution function

For continuous random variable:

$$P(a \le X \le b) = \int_a^b f(x) \, dx = F(b) - F(a)$$

Figure 4.2 $P(a \le X \le b)$ = the area under the density curve between *a* and *b*

Moreover:

$$f(x)=F'(x)$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Example

Problem

The distribution function for the duration of a certain soap opera (in tens of hours) is

$${\mathcal F}(Y) = egin{cases} 1 - rac{16}{y^2} & {\it if } y \geq 4 \ 0 & {\it elsewhere} \end{cases}$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ のQ@

Find $P[4 \leq Y \leq 8]$.

The standard normal distribution

Definition The probability density function

$$f(x)=\frac{1}{\sqrt{2\pi}}e^{-\frac{x^2}{2}}$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

is known as the standard normal distribution.

The standard normal distribution has mean 0 and variance 1.

Problem

Let Z be a standard normal random variable. Compute

- $P[Z \le 0.75]$
- $P[Z \ge 0.82]$
- $P[1 \le Z \le 1.96]$
