Lecture 28: Confidence intervals – notes

Confidence intervals for a population mean

- Normal distribution with known σ (Lecture 24–25)
 - Normal distribution
 - σ is known
 - Large-sample confidence intervals (Lecture 26)
 - ~~Normal distribution~~
→ use Central Limit Theorem → needs $n > 30$
 - ~~σ is known~~
→ replace σ by s → needs $n > 40$
 - Intervals based on normal distributions (this lecture)
 - Normal distribution
 - ~~σ is known~~
- Introducing t -distribution

100(1 - α)% confidence interval

A **100(1 - α)% confidence interval** for the mean μ of a normal population when the value of σ is known is given by

$$\left(\bar{x} - z_{\alpha/2} \cdot \frac{\sigma}{\sqrt{n}}, \bar{x} + z_{\alpha/2} \cdot \frac{\sigma}{\sqrt{n}} \right) \quad (8.5)$$

or, equivalently, by $\bar{x} \pm z_{\alpha/2} \cdot \sigma/\sqrt{n}$.

100(1 - α)% confidence interval

If after observing $X_1 = x_1, X_2 = x_2, \dots, X_n = x_n$ ($n > 40$), we compute the observed sample mean \bar{x} and sample standard deviation s . Then

$$\left(\bar{x} - z_{\alpha/2} \frac{s}{\sqrt{n}}, \bar{x} + z_{\alpha/2} \frac{s}{\sqrt{n}} \right)$$

is a 95% confidence interval of μ

t distributions with degree of freedom ν

Probability density function

$$f(t) = \frac{\Gamma(\frac{\nu+1}{2})}{\sqrt{\nu\pi} \Gamma(\frac{\nu}{2})} \left(1 + \frac{t^2}{\nu}\right)^{-\frac{\nu+1}{2}}$$

$$\alpha \rightarrow t$$

Confidence intervals

Let \bar{x} and s be the sample mean and sample standard deviation computed from the results of a random sample from a normal population with mean μ . Then a **100(1 - α)% confidence interval for μ** , the **one-sample t CI**, is

$$\left(\bar{x} - t_{\alpha/2, n-1} \cdot \frac{s}{\sqrt{n}}, \bar{x} + t_{\alpha/2, n-1} \cdot \frac{s}{\sqrt{n}} \right) \quad (8.15)$$

or, more compactly, $\bar{x} \pm t_{\alpha/2, n-1} \cdot s/\sqrt{n}$.

An **upper confidence bound for μ** is

$$\bar{x} + t_{\alpha, n-1} \cdot \frac{s}{\sqrt{n}}$$

and replacing + by - in this latter expression gives a **lower confidence bound for μ** ; both have confidence level 100(1 - α)%.

Example 1

Example

Let X be the amount of butterfat in pounds produced by a typical cow during a 305-day milk production period between her first and second calves. Assume that the distribution of X is $N(\mu, \sigma^2)$. To estimate μ , a farmer measured the butterfat production for $n = 20$ cows and obtained the following data:

| | | | | | | | | | |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 481 | 537 | 513 | 583 | 453 | 510 | 570 | 500 | 457 | 555 |
| 618 | 327 | 350 | 643 | 499 | 421 | 505 | 637 | 599 | 392 |

- Construct a 90% confidence interval for μ .
- Find a 90% one-sided confidence interval that provides an upper bound for μ .

Example 2

Example

Here is a sample of ACT scores for students taking college freshman calculus:

| | | | | | | |
|-------|-------|-------|-------|-------|-------|-------|
| 24.00 | 28.00 | 27.75 | 27.00 | 24.25 | 23.50 | 26.25 |
| 24.00 | 25.00 | 30.00 | 23.25 | 26.25 | 21.50 | 26.00 |
| 28.00 | 24.50 | 22.50 | 28.25 | 21.25 | 19.75 | |

Assume that ACT scores are normally distributed, calculate a two-sided 95% confidence interval for the population mean.
