#### Mathematical techniques in data science

Lecture 1: General information and Introductions

#### General information

Classes:

MWF 11:30am-12:25am, Ewing Hall 207

• Office hours (starting from the 2nd week):

- Mondays 2:00pm-3:30pm (Ewing Hall 312)
- One more office hour (TBD)
- By appointments
- Instructor: Vu Dinh
- TA: Komali Challa
- Website:

https://vucdinh.github.io/m637f23

#### Data science

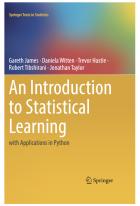

- is an interdisciplinary field that uses scientific methods, processes, algorithms and systems to extract knowledge and insights from data, both structured and unstructured
- is a concept to unify statistics, AI, data analytics, machine learning and their related methods in order to understand and analyze data
- employs techniques and theories drawn from many fields: mathematics, statistics, information science, and computer science

#### Goals of the course

- Become familiar with the basic methods used to analyze modern datasets
- Be able to analyze datasets using Python
- Understand how to select a good model for data
- Understand the mathematical theory and the standard models used in data science

#### Textbook

An Introduction to Statistical Learning. James, Witten, Hastie, Tibshirani, and Taylor. The pdf of the book is available at https://www.statlearning.com

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

# Topics

The materials of the course can be organized

- By problems:
  - Classification
  - Regression
  - Clustering
  - Manifold learning
- By methods:
  - Regression-based methods
  - Tree-based methods
  - Network-based methods

- By meta-level techniques:
  - Regularization
  - Kernel trick
  - Boosting
  - Bootstrapping

# scikit-learn

Machine Learning in Python

- · Simple and efficient tools for data mining and data analysis
- · Accessible to everybody, and reusable in various contexts
- · Built on NumPy, SciPy, and matplotlib
- · Open source, commercially usable BSD license

#### Classification

Identifying to which category an object belongs to.

Applications: Spam detection, Image recognition. Algorithms: SVM, nearest neighbors, random forest.... – Examples

#### Dimensionality reduction

Reducing the number of random variables to consider.

Applications: Visualization, Increased efficiency Algorithms: PCA, feature selection, nonnegative matrix factorization. – Examples

#### Regression

Predicting a continuous-valued attribute associated with an object.

Applications: Drug response, Stock prices. Algorithms: SVR, ridge regression, Lasso, ... – Examples

#### Clustering

Automatic grouping of similar objects into sets.

Applications: Customer segmentation, Grouping experiment outcomes Algorithms: k-Means, spectral clustering, mean-shift.... – Examples

#### Model selection

Comparing, validating and choosing parameters and models.

Goal: Improved accuracy via parameter tuning

Modules: grid search, cross validation, metrics. - Examples

#### Preprocessing

Feature extraction and normalization.

Application: Transforming input data such as text for use with machine learning algorithms.

Modules: preprocessing, feature extraction.

- Examples

#### Keras

#### Simple MNIST convnet

Author: fchollet

Date created: 2015/06/19 Last modified: 2020/04/21 Description: A simple convnet that achieves ~99% test accuracy on MNIST.

🗴 View in Colab 🔸 🕥 GitHub source

#### Setup

import numpy as np
from tensorflow import keras
from tensorflow.keras import layers

### Prerequisites

• Probability theory and basic statistics (e.g. MATH 350 and MATH 450)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

- Knowledge of algorithmic concepts. Comfortable programming in a high-level language
- Multivariable calculus (e.g. MATH 243)
- Linear algebra (e.g. MATH 349)

# Evaluation

- Homework (theoretical + programming problems): 50%
- In-class quizzes and demos: 10%
- Final project: 40% (10% presentation, 30% final report) with a possible **+5% bonus**

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

- Grading system:
- $\geq 94\%~$  At least A
- $\geq 90\%\,$  At least A-
- $\geq$  80% At least B-
- $\geq$  70% At least C-
- $\geq$  60% At least D-
- < 60% F

## Platforms

• We will use Python during the course (there will be sessions to review the language). Specifically, we will use Google Colab for coding and programming assignments:

https://colab.research.google.com

• We will use LaTeX to write the final report. The easiest way to use it collaboratively is to register an Overleaf account:

https://www.overleaf.com

## Homework policy

- Copying solutions in whole or in part from other students or **any other source** without acknowledgement constitutes cheating.
- Any student found cheating risks automatically failing the class and will be referred to the Office of Student Conduct
- You can discuss with other students, but must write up your own solutions/codes

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

• Please note your collaborators on your submissions

# Final project

- Group project: 5-6 people (sign up on Canvas)
- The groups should be formed by the end of Week 4
- Data-oriented projects
  - Pick a practical learning problem with a dataset
  - Analyze the dataset
  - Write a report (in the form of a 4-page IEEE conference paper)

• Present the project (last week of the semester)

#### Final project: some datasets

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

- 1. Fraud detection
- 2. Predict survival on the Titanic
- 3. Predict air pollution
- 4. Predict corporate credit rating
- 5. Predict next-day rain in Australia
- 6. Sign language MNIST
- 7. Job change prediction
- 8. House price prediction
- 9. Healthcare analytics
- 10. Predict water quality

### Final project: scope

- your project should focus on only one task
- you will be graded based on:
  - how you apply the knowledge in the course to approach the problem
  - whether your experiment setups are reasonable to evaluate your methods
  - whether your conclusions are supported by your experiments

- the clarity of your report.
- you are **not** graded based on
  - your model's accuracy
  - whether you can successfully solve the task

### Final project: bonus

You can score a maximum 5% bonus points toward the final course grade by:

- using models/materials that are not covered in class, or
- adding novelty to your project (such as proposing a new method)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Final project: report

- in IEEE conference format
- maximum length: 4 pages + 1 additional page for the references
- should include:
  - An abstract (short paragraph summarizing your work)
  - An introduction (giving an overview of your work)
  - Related work (discussing briefly previous work on the problem)
  - Data and Methods (discussing the problem, the dataset, and your approaches to the problem, etc.)
  - Experiments (detailing your experiment setups to evaluate your methods, presenting and discussing the results of your experiments; include any tables or figures to show your results)
  - Discussions and conclusions (any discussions and conclusions that you can draw from your work)

#### Tentative schedule

• Introduction to (supervised) machine learning (4 weeks)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

- Mathematical techniques in data science (8 weeks)
- Final project presentations (1 week)

# Introduction to supervised learning (4 weeks)

- Week 1: Intros and reviews. Working with Python and sklearn.
- Week 2-3: Basic methods (Nearest neighbors, Logistic regression, LDA, SVM, Decision tree, Feed-forward neural nets). Formulations and demos.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

• Week 4: Deep learning

# Mathematical techniques in data science (8 weeks)

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Meta-level techniques

- Week 5: Intro to statistical learning theory
- Week 6: SVM and the Kernel trick
- Week 7 and 8: Model selection and regularization
- Week 9: Boosting, bagging, bootstrapping

Other learning contexts

- Week 10: PCA and Manifold learning
- Week 11: Clustering
- Week 12: Selected topics

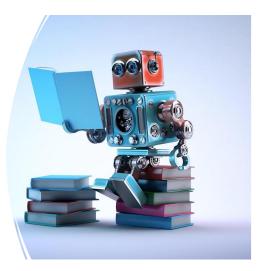

#### Questions?

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ● ●

An introduction to machine learning

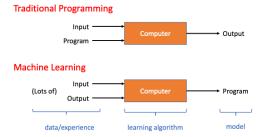

(ロ)、(型)、(E)、(E)、(E)、(O)へ(C)

# What is Machine Learning?

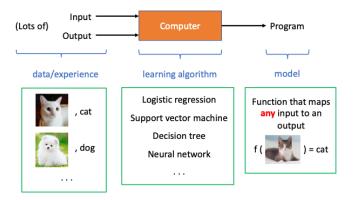

### What is Machine Learning?

 A field that studies "algorithms that allow computer programs to automatically improve through experience." Tom Mitchell (1997)

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

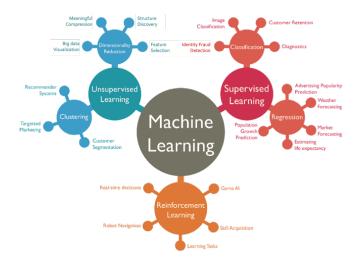

#### Machine learning components

#### **ML** Paradigms

- Supervised learning Learn a function that maps an input to an output (input, output) pairs are given as examples.
- Unsupervised learning Learn patterns from inputs only (no outputs).
- Reinforcement learning Learn to take actions to maximize some reward

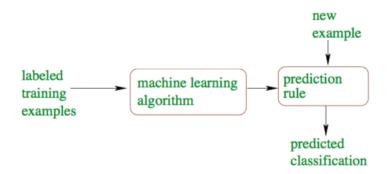

#### **ML** Paradigms

(Source: Abdul Rahid)

#### Supervised learning

In the first 4 weeks, we will focus on supervised learning

Supervised learning: learning a function that maps an input to an output based on example input-output pairs

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

### Supervised learning

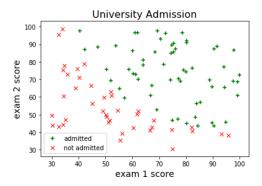

• One example contains both input (X) and output (Y)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

- Two most common tasks:
  - Classification: discrete output Y
  - Regression: continuous output Y

#### Classification or regression?

Example: Predict university admission based on exam scores

 $\rightarrow$  Two classes: admitted/not admitted  $\rightarrow$  Binary classification

・ロト ・ 国 ト ・ ヨ ト ・ ヨ ト

э

#### Classification or regression?

#### Example: Predict house price by living area

 $\rightarrow$  Regression

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

# Classification or regression?

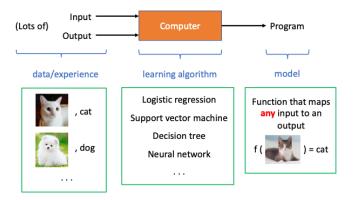

#### Example: Handwritten digit recognition

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

 $\rightarrow$  Multiple classes (labels)  $\rightarrow$  Multi-class classification

#### Machine learning components

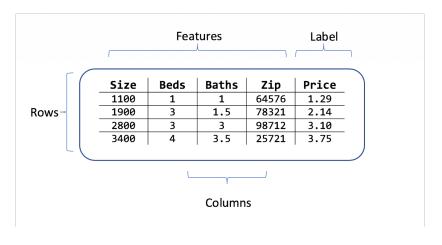

#### Supervised learning: data

- In principle, data can be in any form
- Raw and complex data are hard to use  $\rightarrow$  may need to manually (by humans) extract features before usage

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

- You may also need to pre-process certain features
  - Handle missing values
  - Normalize data

## Sample data

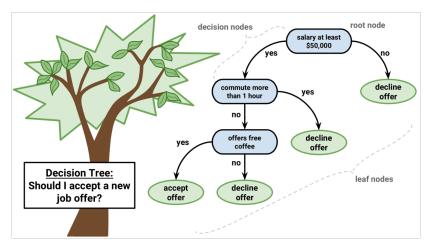

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

(Source: Microsoft)

# Model

Function that takes a pre-processed feature vector and predicts its label

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ○ □ ○ ○ ○ ○

### Learning algorithm

• An algorithm that returns the **parameters** or **configurations** of the model from data

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

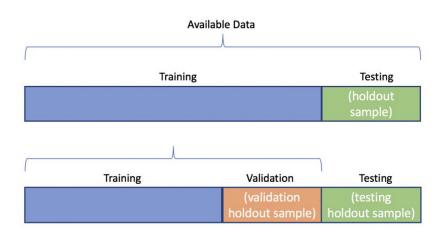

- Note: learning algorithm = training algorithm
- May need to optimize an objective or loss function

#### Evaluate a learned model

- How effective the model makes predictions on new (unseen) data
- Classification: accuracy or error rate
- Regression: average (squared) distance between predicted and true values (mean squared error)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

# Data splitting practices
